

HOW TO START

WOLFX SIGNALS

The main objective of this PDF is **helping you maximize your profits by learning how to start from scratch, manage Take Profits, risk, leverage, and other key factors**. It is not our intention to explain deeply what the cryptocurrencies are, which factors affect changes in their prices, or any other aspect that is not 100% relevant when it comes to successfully following our signals. We will, however, start with a short introduction in order for you to follow everything we explain.

1. WHAT IS A CRYPTOCURRENCY?

A cryptocurrency (or “crypto”) is a digital currency that can be used to buy goods and services and uses an online ledger with strong cryptography to secure online transactions. However, much of the interest in these currencies is to trade for profits or use them as a store of value similar to gold.

Cryptocurrencies work using a technology called blockchain. Blockchain is a decentralized technology spread across many computers that manages and records transactions. Part of the appeal of this technology is its security.

We are going to trade with different cryptocurrencies, which are very volatile and let us take really good profits in short periods of time.

To finish this short introduction, specify that we are going to provide signals with the pair **USDT**, which is a cryptocurrency whose value is always the same as a US dollar. For example, the pair BTC/USDT is 45000, which means a bitcoin is worth 45000\$.

2. WHAT ARE CRYPTO SIGNALS?

Crypto Signals are a set of instructions sent out from a signal provider to an individual telling them what cryptocurrency to buy, the price to buy at, what portion of their portfolio they should invest, what leverage they must use and at what price to set the take profits and the stop loss.

★ **In our channel, we are going to operate with futures, which means that we operate crypto signals, but with leverage.**

3. OK BUT... HOW DO I START?

Step 1: Download the following apps:

- Telegram (available in App Store and Play Store)
- Binance (available in App Store and Play Store)

Step 2: Register a Binance account:

- a. Open the Binance app and click "Register".
- b. Enter your email, password and **make sure to enter the referral ID to get a 10% bonus in commissions: Q5QQTZR**

Step 3: Deposit your funds in your broker

You have to deposit your money and then buy USDT in "Markets", since we are going to do all the operations with this pair. Finally, you must transfer the USDT from your main wallet to the **"USD (\$) -M Futures" wallet**, which is where we will operate (make sure you have activated your Binance Futures account).

4. HOW TO FOLLOW OUR SIGNALS STEP BY STEP

Following our signals is **very easy**, but there are some things you have to take into account if you want to do it successfully. It is vital that you keep your phone with you all day long, as you have to enter your trades as soon as we send the signals. This way, you will be able to pick the same (or very similar) prices as us, radically increasing your chances of obtaining profits.

The process is the following:

1. We send a signal to our telegram channel

WolfX Crypto Futures VIP

AKRO/USDT  **BUY 4610**

 TP1 4630

 TP2 4690

 TP3 4795

 SL 4450

 Leverage 10x

2. Open your Binance App, and click the search button

3. Search the pair we have given you in the signal (*in this case AKRO/USDT*)
There will be two option in the upper part, make sure you are in **Futures** market

4. Once you're in, click the button Buy or Sell, depending what we specify (*in this case Buy*)

5. Then make sure to put **ISOLATED** and, next to it, the leverage we told you (*in this case 10x*). You also have to set the TP and the SL by clicking the "TP/SL" button indicated in the screenshot

6. Put the entry price that we have sent in the rounded box (*in this case 0.04610*) and select the percentage of your total funds you want to use in this operation (**we recommend using between 3% and 5%**). To execute the order, click the Buy button

- ★ **IMPORTANT:** In the telegram channel, we will send the signals without ceros, to be easier to understand. *Example: if the entry value is 0.04610, we will send the entry value as 4610*

*As you can notice, we provide three take profits. We will explain how to manage them later in the PDF.

5. WHAT IS LEVERAGE?

Imagine you want to buy a 100000\$ house, so you go to a bank to take out a loan. The bank requires you to supply 20% of the value of the property as a down payment on the loan. The result is that, for 20000\$, you are able to access a property valued in 100000\$. This is an example of leverage in real state. You have bought the house at a leverage of 5:1 (because 20000 is 1/5 of 100000).

One year later, the real estate market has appreciated by 50%, so your house is now valued in 150000\$. You decide to sell it, making a 50000\$ profit. If you had not asked for a loan, and instead you had bought a 20000\$ studio, after a 50% increase in value you would have sold it for 30000\$, with only a 10000\$ profit. So, basically, your 5:1 leverage has allowed you to make 5 times more than you would have if you had traded without profit.

Now, let's apply this logic with a crypto trade: imagine you buy BTC at 30000\$ with TP1 at 30200\$, and leverage is 10x. If it hits TP1, the % profit you take is $(30200/30000)*100$, which is 0.66% if you wouldn't have had leverage. However, with

leverage, you multiply that % by 10, so your total profit when it hits TP1 is 6.66% of your initial amount.

6. HOW TO MANAGE TAKE PROFITS

The management of Take Profits depends on the level of risk you want to assume and the amount of money you have invested in your account. There are different ways in which you can manage this, but we consider the following (option 1) to be the best for those who are starting to trade:

Option 1:

Binance Futures does not let you open 1 trade with more than 1 TP, so you should open 3 different trades, in the following way:

- One trade setting the TP1. This trade should have 70% of the percentage of your total funds you want to use in this operation. Therefore, if you are using a percentage of 10%, this trade should have a percentage of 7%.
- Another trade setting the TP2, with 20% of your percentage (which would be 2%).
- A third trade setting the TP3, with the pending 10% of your percentage (1%).

Advantage of using this method:

- Trades will close automatically when they hit the TPs, meaning you will not have to be so alert to the market's movements. This will lower the risk, which is perfect for those who are starting to trade.

Disadvantage of using this method:

- Less risk means also fewer potential gains. The fact that trades close automatically limits your potential gains.

Risk management strategy especially designed for beginners to minimize risk:

You should open the three trades in the following way:

- **Trade 1:**
 - Opening price: the one we give
 - TP: our TP1.
 - SL: the one we give.
 - Percentage: 70% of your total percentage.

- **Trade 2:**
 - Opening price: the one we give
 - TP: our TP2.
 - SL: the one we give. When your first trade closes (when it hits TP1), you should move the SL to either the market execution price (the price in which you opened the trade) or to TP1 price.
 - Percentage: 20% of your total percentage.

- **Trade 3:**
 - Opening price: the one we give
 - TP: our TP3.
 - SL: the one we give. When your first trade closes (when it hits TP1), you should move the SL to either the market execution price (the price in which you opened the trade) or to TP1 price. Following the same logic, when the second trade closes, you change the SL to either the market execution price (the price in which you opened the trade), to TP1 price or to TP2 price.
 - Percentage: 10% of your total percentage.

Option 2:

This option consists in opening a single trade with no TPs, placing only the Stop Loss. You will then have to be extremely alert to the market's movements, so when the trade hits TP1, you should close 70% of the trade; when it hits TP2, close 20%; and when it hits TP3, close the pending 10%. **You can, however, modify these percentages depending on the risk you are willing to assume.**

For example, if you open a trade with a percentage of 10%: you will close 7% (70%) when it hits TP1, leaving the pending operation with a percentage of 3%. You will then close 2% (20%) when it touches TP2, leaving the pending operation with a percentage of 1%. Finally, you will close the rest (1% (10%)) when it hits TP3.

Advantage of using this method:

- The absence of Take Profits gives you the opportunity to close trades whenever you want, which means potential unlimited gains.

Disadvantage of using this method:

- In order for it to work well, you have to be very alert to the markets, as the operations will not close automatically. Therefore, this is a much riskier option, only recommended for more experienced traders.

***The percentages we use (70% for TP1, 20% for TP2 and 10% for TP3) are just our recommendations. They are oriented to beginners (as they minimize risk), so you can vary them whenever you feel comfortable enough to assume bigger risks.**

7. FINAL RECOMMENDATIONS

- Crypto trading requires a high amount of patience and discipline. You should not assess your results the same day you start. Wait some weeks as you learn how to follow our signals and manage your funds correctly.
- If your initial inversion is low, don't assume huge risks to get bigger gains faster. This is a mid/long-term thing, so don't expect to go from 100 to 1000\$ in one week. Instead, be disciplined and constant, and remember that your gains will compound little by little.
- **ENJOY YOUR PROFITS!**
